

8.2

- (a) The method takes an array of integers and multiplies each by 1.
- (b) The method takes 2 inputs, an array of integers and an integer. The loop looks for a match between the integer and the values in the array. If a match is found the location/index is returned. If not match is found -1 is returned.
- (c) The method counts the number of times the integer stored as "apple" appears in the array of integers called "a". The count is returned.
